Naive transcript synthesis vs fast checkpoints vs independent agents

PROVISIONAL | Naive 45/45 validated; fast 45/45 and independent 20/20 audited | as of 2026-10-15 20:59 UTC

Dots are individual successes; lines are means. Older cells n=5/5; orange labels give naive n/5. Pending cells have no plotted zero.
Baseline-eligible endpoint. Different cache, model load and checker queues confound timings. Synthesis time remains inside the group clock.
